THE JPEG XL PLAYBOOK

Are you ready for JXL?

How to start using JPEG XL for your photos, archives and websites, one play at a time.

01 PROBLEM · 02 SOLUTION · 03 RESULT

jpeg.org/jpegxl

A PLAYBOOK BY David Soden

START HERE

The playbook at a glance

JPEG XL is a newer image format, saved as .jxl, that holds the same picture as a JPEG in fewer bytes. Chrome 155 turned it on by default on October 6, 2026, and Firefox 158 followed on October 13. Safari has shown it since 2023, and Windows 11 opens it with a free extension from Microsoft. This playbook shows how to start using it now, where it saves you space today, and where to keep using JPEG a while longer.

It runs in order: the problem, then what JPEG XL does about it, then what good looks like. Ten plays follow, each with a clear finish line. Every number in it comes from tests run for this playbook in October 2026, or from the source listed at the back.

01	02	03
Problem	**Solution**	**Result**
Photo libraries keep growing, and the last new format, WebP, reached browsers years before desktops could open it.	JPEG XL makes smaller files at the same quality, turns any JPEG into a smaller file and back, and now opens in the major browsers and operating systems.	Lighter archives, faster pages and better masters, with a plain JPEG always one command away.

How to use it

- Read the problem, solution and result once. They take about five minutes.
- Do Play 1 first. It tells you what your own devices can open, and it takes two minutes.
- Play 2 installs the free converter. Most of the other plays need it.
- Then jump to the play that matches your job. Each one stands on its own.
- Commands sit in dark boxes marked RUN THIS. Requests for an AI assistant are marked SAY THIS. Copy either word for word, then change the file names to yours.

Check your browser first

The test page shows a JPEG XL image beside the same picture in older formats, with file sizes and quality scores. If the JXL image appears, that browser is ready. Play 1 covers the rest of your devices.

01 THE PROBLEM

Images keep getting heavier, and the last new format burned everyone.

Phone cameras shoot 48 megapixels now. A family photo library passes a terabyte, a product catalog holds tens of thousands of shots, and the backup drive fills up again. Nearly all of those pictures are JPEGs, a format standardized in 1992.

Newer formats have come along without replacing it. WebP made smaller files for the web, but for years Windows, macOS and most editors couldn't open it, so anyone who saved a picture from a website could end up with a file nothing on their computer would show. People learned to distrust new image formats from that, and it's fair to ask whether JPEG XL is the next WebP.

What usually goes wrong

- A JPEG archive eats storage, and the only way to shrink it is to re-save at lower quality and lose detail for good.
- A web page ships images at twice the size they need to be, and every visitor on a phone pays for it.
- Lossless masters, scans and screenshots sit in PNG files several times larger than they need to be.
- HDR and 16-bit photos get flattened to 8-bit JPEG for sharing, because nothing else opens everywhere.
- Someone sends a newer format, the recipient can't open it, and the whole team swears off the format.
- Nobody checks which formats their own devices and apps support, so the decision runs on rumor.

Who feels it

Photographers with years of RAW and JPEG files. Web developers and site owners chasing page speed. IT and records teams who pay for archive storage. Designers who move transparent and HDR work between apps. And anyone whose phone keeps saying the storage is full.

02 THE SOLUTION

One smaller format that now opens almost everywhere.

JPEG XL is an open, royalty-free image standard, ISO/IEC 18181, from the committee that made the original JPEG. It compresses with loss like JPEG or without loss like PNG, and it does things neither of them can. The reference tools, libjxl, are free and open source.

The part that matters most this month is support. Chrome 155 turned JPEG XL on by default on October 6, 2026, and Firefox 158 did the same on October 13. Safari, iPhone, iPad and Mac have shown it since 2023. Windows 11 version 24H2 and later reads it with Microsoft's free JPEG XL Image Extension from the Microsoft Store. That's the difference from WebP: the operating systems were ready before the last big browsers switched it on.

What it does

Smaller at the same quality	In a test of four photos matched for quality, JPEG XL files came in 28% smaller than JPEG and 22% smaller than WebP.
Lossless JPEG conversion	Any existing JPEG converts to a smaller .jxl, and back to the identical original file, byte for byte. Eight camera JPEGs shrank 18% this way.
Lossy or lossless	One format covers photos, where lossy is fine, and masters, scans and graphics, where you'd otherwise reach for PNG.
Transparency and animation	An alpha channel like PNG and animation like GIF, in the same file type.
More than 8 bits	Up to 32 bits per channel, floating point included, so gradients and repeated edits hold up. JPEG stops at 8 bits, 256 levels per channel.
HDR	HDR with the PQ and HLG curves and wide color gamuts, for photos shot on HDR phones and cameras.
Progressive and huge images	The image is coded in 256-pixel groups. A browser can show a rough preview early and sharpen it, the encoder can send the center or the subject first, and a viewer can decode one region of a huge image without reading all of it. One side can run past a billion pixels.

03 THE RESULT

Smaller files with the same pictures, and a way back.

What you end up with

- A photo archive that's smaller with no loss, and every JPEG can come back unchanged.
- Web pages that send JXL to Chrome, Firefox and Safari, with a fallback for everyone else.
- Masters that keep HDR, 16-bit color and transparency in one file type.
- A rule for when to send JXL and when to send JPEG.
- A list of the apps you rely on, and which of them still need to add JXL.

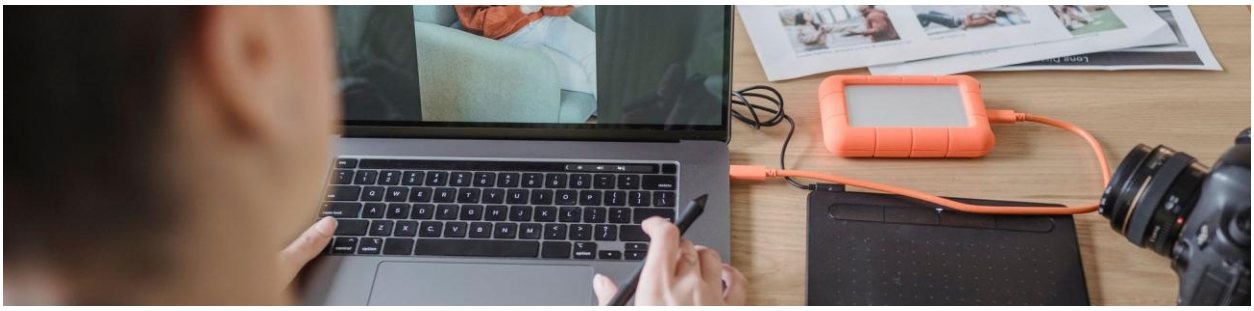

How you'll know it's working

MEASURE	WHAT GOOD LOOKS LIKE
Archive size	15 to 20% smaller after a lossless JPEG conversion. Eight test photos went from 16.1 MB to 13.1 MB.
Round trip	Every file you spot-check turns back into a JPEG identical to the original. Compare checksums, not your eyes.
Page weight	Image bytes per page fall for Chrome, Firefox and Safari visitors, and Edge visitors still see every picture.
Opening files	Everyone you send a .jxl to opens it without asking how.
App coverage	Each app on your list reads JXL, or its developer has your request.

> JPEG XL won't rescue a bad photo. A low-quality JPEG converts exactly as it was, artifacts included. And an app without JXL support can't open the file at all, so convert back to JPEG for those.

04 THE PLAYS

Ten plays, in the order you'll need them

Each play has a goal, what it's good for, what it pairs with, a few steps and a finish line. Commands work in a terminal on Windows, macOS or Linux. The SAY THIS requests work in Claude Code, Codex, Copilot or any AI assistant that can run commands on your files.

PLAY 1

Check what you can already open

Goal: know which of your devices and apps show JPEG XL today.

Use it for: deciding where JXL is safe before you convert anything.

1. Open the JPEG XL test page (jpegxl.info/resources/jpeg-xl-test-page) in each browser you use. If the JXL image shows, that browser is ready.
2. Chrome needs version 155 or later, Firefox 158 or later, and Safari 17 or later. Microsoft Edge 155 doesn't show JPEG XL yet, even though it's built on the same Chromium release as Chrome 155. Microsoft hasn't said when it will.
3. On Windows 11, install Microsoft's JPEG XL Image Extension. It adds thumbnails in File Explorer and lets Photos open .jxl files. It needs version 24H2 or later and won't install on Windows 10.

   RUN THIS
   ```
   winget install 9MZPRTH5C0TB
   ```

4. On a Mac, iPhone or iPad there's nothing to install from macOS Sonoma and iOS 17 onward. Finder, Preview and Safari open .jxl files.
5. Write down the three or four apps you open images in most, and check each one's open and save dialogs for JPEG XL. Play 9 covers the ones that don't have it.

YOU'RE DONE WHEN
you have a list of which browsers, devices and apps on your desk show a .jxl file.

PLAY 2

Install the free converter

Goal: cjxl and djxl, the official JPEG XL tools, working on your computer.

Use it for: every play that converts files.

Pairs with: ImageMagick if you already script image work, and any AI assistant that can run commands.

1. Install libjxl, the reference tools from the JPEG XL authors. Version 0.12.0, released July 1, 2026, is current.

   RUN THIS

   ```
   Windows:         winget install libjxl.libjxl
   macOS:           brew install jpeg-xl
   Debian, Ubuntu:  sudo apt install libjxl-tools
   ```

2. Open a new terminal and check that it works.

   RUN THIS

   ```
   cjxl --version
   ```

3. Learn the four settings you'll actually use.

SETTING	WHAT IT DOES
-d 0	Lossless. Distance 0 means no difference from the source. It's the default for JPEG and GIF input.
-q 90	Quality from 0 to 100, like a JPEG slider. The tool's own help calls 90 visually lossless and recommends 68 to 96.
-e 7	Effort from 1 to 10. Higher is slower and a little smaller. 7 is the default.
-j 0	Re-encode a JPEG from its pixels instead of converting it losslessly.

4. Prefer a window to a terminal? XnView MP reads and writes JXL and converts whole folders. GIMP 3, Krita, darktable and Photoshop 26.8 and later can export it too.

> YOU'RE DONE WHEN
> cjxl --version prints a version number.

PLAY 3

Shrink a JPEG archive without losing a byte

Goal: an archive of JPEGs stored as .jxl, 15 to 20% smaller, with every original recoverable.

Use it for: photo libraries, scanned documents, client archives and backups.

Pairs with: your backup tool, and a checksum command such as sha256sum or PowerShell's Get-FileHash.

1. Copy a test folder of 20 or 30 JPEGs. Never start on the only copy.
2. Convert one file. cjxl converts JPEG input losslessly by default, so it needs no settings.

   RUN THIS
   ```
   cjxl photo.jpg photo.jxl
   ```

3. Turn it back into a JPEG and compare checksums. They should match exactly.

   RUN THIS
   ```
   djxl photo.jxl photo-back.jpg
   sha256sum photo.jpg photo-back.jpg          (macOS, Linux)
   Get-FileHash photo.jpg, photo-back.jpg      (Windows PowerShell)
   ```

4. Do the whole folder. An AI assistant can write and run the loop, and check every file before you touch an original.

   SAY THIS
   ```
   Convert every JPEG in this folder to JPEG XL with cjxl, losslessly. For each one,
   rebuild the JPEG with djxl and compare its SHA-256 checksum with the original. Show me
   a table of sizes and results, and don't delete anything.
   ```

5. Once every checksum matches, decide what to do with the originals. Keep them until your backup holds the .jxl copies and you've opened a sample on each device you use.

> YOU'RE DONE WHEN
> every checksum matches and the folder is smaller. In the test for this playbook, eight camera JPEGs went from 16.1 MB to 13.1 MB and all eight came back identical.

PLAY 4

Save new photos as JPEG XL

Goal: finished exports saved as .jxl at a quality you chose, with a JPEG made only when someone needs one.

Use it for: photo exports and the finished masters you keep.

Pairs with: Photoshop, GIMP 3, Krita, darktable, Affinity Photo 2 or XnView MP.

1. Start from the best source you have: the RAW file, a TIFF, a PNG or a 16-bit export. Turning a JPEG into a lossy JXL compresses it twice, so use Play 3's lossless conversion for JPEGs instead.
2. Pick a quality. Start at 90 and only go lower once you've compared the results.

RUN THIS

```
cjxl edit.png edit.jxl -q 90
```

3. In an editor, look for JPEG XL in the export or save dialog. In Photoshop it's under File > Save a Copy. Photoshop's export is newer than the others, so check the result on 16-bit work.
4. Compare the .jxl with the source at 100% zoom where it matters: faces, fine text and skies.

> YOU'RE DONE WHEN
> your editor's default export for finished photos is JPEG XL, and you only make a JPEG when someone asks for one.

PLAY 5

Serve JPEG XL on your website, with a fallback

Goal: Chrome, Firefox and Safari visitors get .jxl images, and everyone else still gets a picture.

Use it for: photo-heavy pages, portfolios, product pages and blogs.

Pairs with: a frontend design skill or your framework, and an image CDN if you use one.

1. Make a .jxl next to each image you already serve. Keep the JPEG or WebP.
2. Wrap each image in a picture element, so a browser that can't show JXL moves on to the next source.

ADD THIS

```
<picture>
  <source srcset="hero.jxl" type="image/jxl">
  <source srcset="hero.webp" type="image/webp">
  <img src="hero.jpg" alt="..." width="1920" height="1080">
</picture>
```

3. Make sure your server sends .jxl files with the content type image/jxl. If it doesn't, add the type to your server or host's MIME settings.
4. If you use an image CDN, check whether it can make JXL for you. Fastly Image Optimizer outputs it, and its automatic format setting tries JXL first. Cloudinary has served JXL since 2020. Cloudflare Images and imgix don't offer JXL output as of October 2026.
5. WordPress core doesn't accept JXL uploads yet. The work is open and has moved to version 7.2 or later, so serve it through a CDN for now.
6. Test in Edge. It should get the WebP or the JPEG, never a broken image.

SAY THIS

```
Make a JPEG XL copy of every photo on this site with cjxl at quality 85. Wrap each img
in a picture element with the JXL source first and the existing file as the fallback,
and add image/jxl to the server's MIME types.
```

YOU'RE DONE WHEN

Chrome's network panel shows .jxl images and Edge shows the fallback, with nothing broken on the page.

PLAY 6

Keep HDR and 16-bit work in one file

Goal: HDR photos and high-bit-depth edits stored without flattening them to 8-bit JPEG.

Use it for: HDR photos from phones and cameras, and edits you'll come back to.

Pairs with: darktable, Krita, GIMP 3 or Photoshop, and your RAW workflow.

1. Export your master from the editor as a 16-bit TIFF or PNG, or straight to JXL if the editor writes it at full depth.
2. Convert it losslessly, so nothing about the master changes.

RUN THIS

```
cjxl master.png master.jxl -d 0
```

3. For HDR, keep the HDR color profile (PQ or HLG) in the source file. JPEG XL stores it as is. Chrome 155 and Firefox 158 both list HDR in their JPEG XL support.
4. If you shoot ProRAW on an iPhone 16 Pro or later, look for the JPEG-XL options in the camera's format settings. Apple's estimate for a 48-megapixel ProRAW photo is about 46 MB with lossless JPEG XL and 20 MB with lossy, against about 75 MB without it. Samsung's Expert RAW on the Galaxy S24 also writes DNG files with JPEG XL inside.

> YOU'RE DONE WHEN
> your masters keep their full bit depth and HDR, and you only flatten to 8-bit JPEG for someone whose app needs it.

PLAY 7

Replace PNG where it's heavy

Goal: lossless images that take less space than PNG.

Use it for: scans, lossless photo masters, transparent images and stored screenshots.

Pairs with: your screenshot tool and documentation folders.

1. Convert a PNG losslessly.

   RUN THIS
   ```
   cjxl image.png image.jxl -d 0
   ```

2. Expect the biggest win on photos. Two 1920-pixel photos stored losslessly came out 37 to 38% smaller as JXL than as PNG, and 9 to 14% smaller than lossless WebP.
3. On flat graphics, test before you switch. Five screenshots of document pages came out 37% smaller than PNG as JXL, but lossless WebP beat both at 52% smaller. Raising the effort to -e 9 brought JXL to 40%, still behind WebP.
4. Keep PNG for anything you send to people or paste into apps that don't read JXL yet.

> YOU'RE DONE WHEN
> your stored lossless images are smaller, and you chose the format for each kind of image from your own test.

PLAY 8

Share without causing a WebP moment

Goal: nobody you send a picture to gets a file they can't open.

Use it for: emailing photos to friends and handing files to clients.

Pairs with: the djxl command from Play 3.

1. Send .jxl only to people you know can open it: Chrome and Firefox users, Mac and iPhone users, and Windows 11 users with the extension.
2. Send everyone else a JPEG. If the .jxl came from a JPEG through Play 3, djxl gives you the exact original back. From any other .jxl, it makes a new JPEG.

RUN THIS
```
djxl photo.jxl photo.jpg
```

3. Don't upload .jxl files to social platforms or messaging apps. As of October 2026, none of the big ones document JXL uploads.
4. When you do send one, add a line saying it's a JPEG XL file and that Windows 11 opens it after a free extension from the Microsoft Store.

YOU'RE DONE WHEN
every file you share opens on the first try.

PLAY 9

Ask your apps for support

Goal: the apps you depend on read and write JPEG XL.

Use it for: the apps from your Play 1 list that don't support it yet.

1. Check the app's release notes and feature request board first. Many have an open request you can add your vote to.
2. Send a short request that says what you'd use it for.

SEND THIS
```
Please add JPEG XL (.jxl) support for opening and saving files. Chrome 155, Firefox
158 and Safari display it, Windows 11 and macOS open it, and libjxl and jxl-rs are
open-source libraries you can build on. I'd use it for [your use].
```

3. Revisit the list every quarter. Support has been arriving one app at a time.

YOU'RE DONE WHEN
every app on your list supports JXL or has your request on file.

PLAY 10

Make it a habit

Goal: JPEG XL becomes your default where it's safe, with no surprises.

1. Write down your rule. For most people it's JXL for storage and the web, and JPEG for sharing with anyone outside your circle.

2. If you work with an AI assistant, add a line to the project's instructions file (CLAUDE.md, AGENTS.md or your tool's equivalent): save finished images as JPEG XL with a JPEG or WebP fallback on the web, and never delete an original until its round-trip checksum matches.
3. Follow the rhythm below.

> **YOU'RE DONE WHEN**
> you reach for .jxl without thinking, and nobody has had to ask you how to open one.

WHEN	DO THIS
Starting a project	Decide where JXL is safe: storage, the web with a fallback, or neither.
Exporting finished work	Save a JXL master, and make a JPEG only for people who need one.
Before archiving	Convert JPEGs losslessly and check the checksums (Play 3).
Every quarter	Run Play 1 again. Edge and your apps may have added support.
When a new app joins your kit	Check that it reads JXL, or send the Play 9 request.

SIDE BY SIDE

Where JPEG XL fits among the formats you already use

You don't need to drop the other formats. Each one still has a job.

FORMAT	BEST FOR TODAY	WATCH OUT FOR
JPEG	Sending photos to anyone, anywhere	8 bits only and no transparency. Its files are the biggest of the group
PNG	Graphics and screenshots you send to other people	Very large files for photos
WebP	Web images, and lossless flat graphics	8 bits per channel at most, and some desktop apps still balk
AVIF	Web images, especially at small file sizes	Windows needs two Store extensions (HEIF and AV1 Video), and there's no lossless JPEG conversion
JPEG XL	Archives, masters, HDR, and web images with a fallback	No Edge support yet, and many apps still can't open it

FEATURE	JPEG	PNG	WEBP	AVIF	JPEG XL
Lossy	Yes	No	Yes	Yes	Yes
Lossless	No	Yes	Yes	Yes	Yes
Transparency	No	Yes	Yes	Yes	Yes
Animation	No	APNG	Yes	Yes	Yes
Bits per channel	8	Up to 16	8	Up to 12	Up to 32
HDR	No	2025 spec	No	Yes	Yes
Progressive loading	Yes	Interlaced	No	Limited	Yes
Lossless JPEG conversion	-	No	No	No	Yes

AVIF is the closest rival, and on photos at small sizes it often matches or beats JPEG XL. In the test for this playbook it won three of four photos. JPEG XL took the most detailed photo by enough to win the total, and it's the only one of the five that converts an existing JPEG without loss.

WHAT'S POSSIBLE

Ideas by who you are

The plays cover the common jobs. Here's what else people can do once their tools read JXL.

A photographer	Convert the JPEG side of your archive losslessly. Keep edited masters as 16-bit JXL. Deliver web galleries in JXL with a JPEG fallback.
A web developer	Add a JXL source to the picture elements on image-heavy pages. Turn on JXL output in your image CDN where it exists. Firefox 158 now lists image/jxl in its Accept header, so servers can choose the format per request.
An IT or records team	Shrink scanned-document and photo archives without changing a byte of what comes back. Put the round-trip check into the archive script.
A designer	Keep transparent and high-bit-depth assets in one format. Export from Krita, GIMP 3 or Photoshop and hand off JPEG or PNG only at the end.
Everyone else	Install the Windows extension so .jxl files open. Convert the phone-photo backup on your PC to save space. Ask the apps you use to add support.

Where it's going next

The PDF Association chose JPEG XL in 2025 as its preferred way to bring HDR images into PDF, and that work is under way. JPEG XL is also an investigation area in Interop 2026, the yearly project where browser makers test features together, which builds the shared tests every browser is checked against. Edge is the big browser still missing.

05 THE NUMBERS

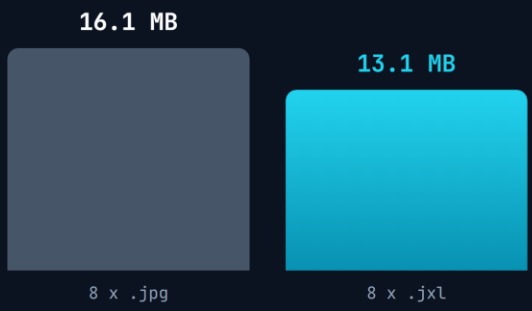

What JPEG XL saved on real photos

These results come from tests run for this playbook in October 2026, on eight full-resolution photos from Pexels, including the ones on its cover and section pages. The tools were cjxl and djxl 0.12.0 and Pillow 12.1, run on Windows 11.

LOSSLESS, FROM JPEG

Eight camera JPEGs, 18% lighter, nothing lost

Converted with cjxl at its default settings, then turned back into JPEG with djxl. All eight came back byte-for-byte identical to the originals. Savings per file ran from 16% to 30%.

SAME QUALITY, FEWER BYTES

Four photos at 1920 px, matched for quality

Each format's quality setting was raised until every photo scored at least 80 on SSIMULACRA2, a perceptual quality metric. Encoders: Pillow 12.1 for JPEG, WebP and AVIF, cjxl 0.12.0 for JPEG XL. Measured October 2026.

How the lossy test worked

For the lossy test, each photo was resized to 1920 pixels wide, and each format's quality setting was raised until the file scored at least 80 on SSIMULACRA2, a perceptual quality metric on which 80 means very high quality. That way every format is judged at the same visible quality, and only the file size differs.

PHOTO	JPEG	WEBP	AVIF	JPEG XL
Kolsai Lake landscape	811 KB	791 KB	762 KB	697 KB
Editing at a laptop	220 KB	173 KB	101 KB	118 KB
Light through a prism	127 KB	110 KB	45 KB	48 KB
Printed photos at a desk	215 KB	194 KB	114 KB	126 KB
Total	1,372 KB	1,268 KB	1,022 KB	989 KB

BE FAIR ABOUT IT

AVIF made the smallest file for three of the four photos. JPEG XL won the most detailed one by enough to take the total. On flat graphics stored losslessly, WebP beat JPEG XL (see Play 7). Where JPEG XL has no rival is the lossless JPEG conversion, since no other format turns an existing JPEG into a smaller file and gives back the original. Your own images will land somewhere else, so test a sample before you convert a library.

06 GROUND RULES

When to hold off

JPEG XL is ready for plenty of jobs, but not every one. These rules keep it from turning into the next WebP story.

Delete an original before the check	Keep every original until djxl rebuilds it with a matching checksum and your backup holds the .jxl copy.
Count on Edge	Edge 155 doesn't show JPEG XL. Every use on the web needs a fallback.
Count on Windows 10	Microsoft's extension needs Windows 11 version 24H2 or later. On older Windows, people need a viewer such as XnView MP, or IrfanView with its plugin.
Expect animation in Safari	Safari shows still JXL images only. Use video or animated WebP for motion on the web.
Assume your code library has it	Python's Pillow needs the pillow-jxl-plugin package, and the prebuilt binaries of sharp, the Node image library, can't write JXL. Check before you build a pipeline on either.
Re-compress a JPEG lossily	Turning a JPEG into a lossy JXL stacks a second round of compression on the first. Use the lossless conversion for JPEGs.

07 QUICK REFERENCE

Commands you'll use

These cover nearly everything in the plays.

RUN THIS	WHAT YOU GET
`winget install libjxl.libjxl`	The cjxl and djxl tools on Windows (brew install jpeg-xl on a Mac)
`winget install 9MZPRTH5C0TB`	Microsoft's JPEG XL Image Extension, on Windows 11 24H2 and later
`cjxl photo.jpg photo.jxl`	A smaller, lossless copy of a JPEG
`djxl photo.jxl photo.jpg`	The original JPEG back, byte for byte
`cjxl image.png image.jxl -d 0`	A lossless JXL from a PNG or TIFF
`cjxl image.png image.jxl -q 90`	A lossy JXL that looks like the source to most eyes
`cjxl image.png image.jxl -q 85 -e 9`	A smaller file that takes longer to encode
`cjxl photo.jpg photo.jxl -j 0 -q 80`	A lossy re-encode of a JPEG, for when size matters more than getting the original back
`djxl image.jxl image.png`	A PNG for apps that can't read JXL
`jxlinfo image.jxl`	Size, bit depth and color, and whether the file can rebuild a JPEG

Every tool here is free. libjxl is open source under the BSD license, and the Windows extension is free from the Microsoft Store.

08 SOURCES
